

Q3.

Flask to build a web application
uWSGI as a production server
requests to exercise your server

To install all of these dependencies, use pip:

```
$ pip install flask uwsgi requests
```

In a file called server.py, you create a Flask application:

```
# server.py
from flask import Flask

SECRET_MESSAGE = "fluffy tail"
app = Flask(__name__)

@app.route("/")
def get_secret_message():
    return SECRET_MESSAGE
```

You write a script called client.py that will help them get the secret message:

```
# client.py
import os
import requests

def get_secret_message():
    url = os.environ["SECRET_URL"]
    response = requests.get(url)
    print(f"The secret message is: {response.text}")

if __name__ == "__main__":
    get_secret_message()
```

This code will print out the secret message as long as they have the SECRET_URL environment variable set. In this case, the SECRET_URL is 127.0.0.1:5683.

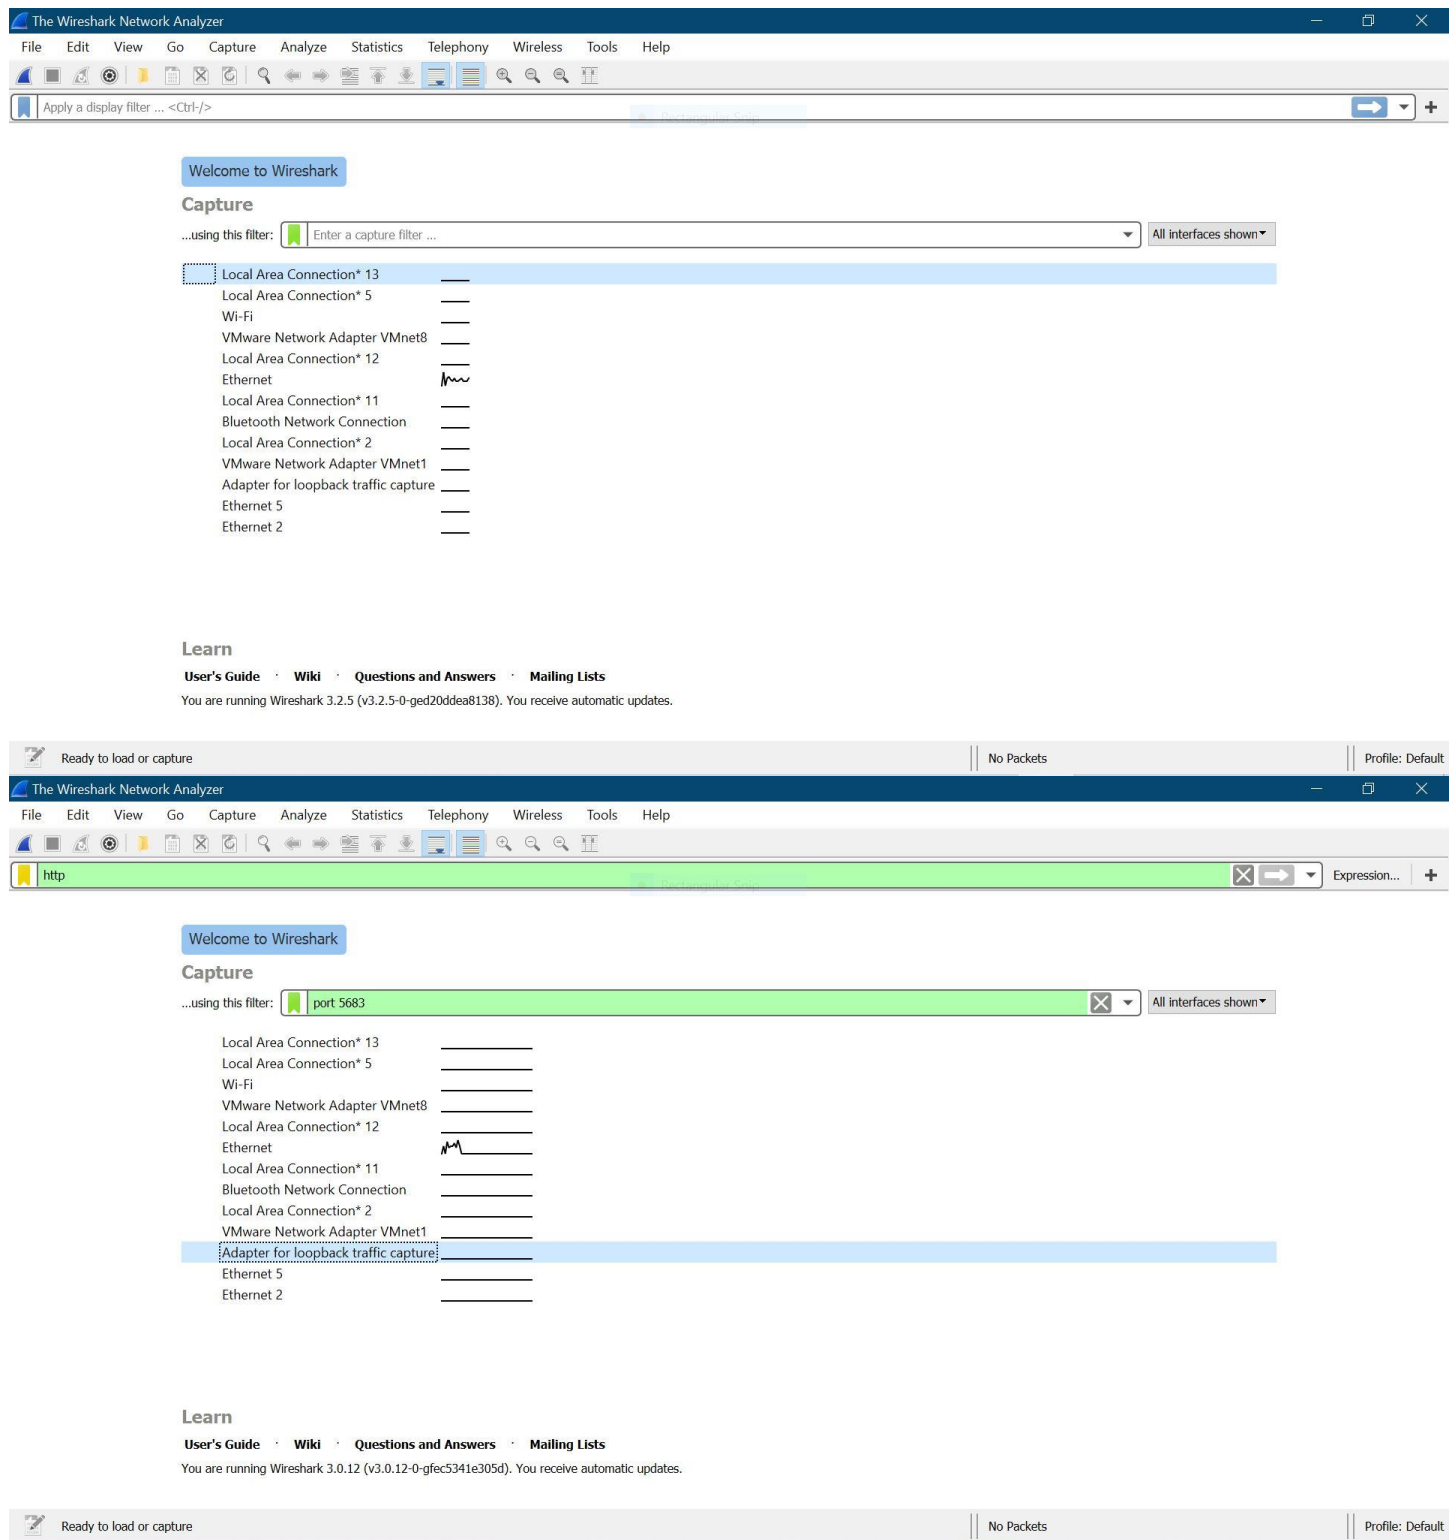

Deploy your application on your secret server and run it:

```
chiu@LAPTOP-EON0OEAL:~$ clear
chiu@LAPTOP-EON0OEAL:~$ uwsgi --http-socket 127.0.0.1:5683 --mount /=server:app

```

← → ↻ 🏠 ⓘ localhost:5683

fluffy tail

Type port 5683 in the capture filter and http in the display filter on Wireshark:

When you expand the Hypertext Transfer Protocol layer, you can see all the information that makes up an HTTP Request:

*Adapter for loopback traffic capture (port 5683)
